

jQuery Elements & Filters

Elements

.before()

.after()

.prepend()

.append()

.remove()

.clone()

.unwrap()

.detach()

.empty()

.add()

Filters

.filter()

.not()

.has()

.is()

:contains()

Elements – inserting new and adding new content

`.before()` inserts content before the selected element

`.after()` inserts content after the selected element

`.prepend()` inserts content inside the selected element
after the opening tag

`.append()` inserts content inside the selected element
before the closing tag

Elements – inserting new and adding new content

Creating new elements

```
var $newFragment = $('<li>');
```

creates a variable newFragment to store a jQuery object which contains an empty element

```
var $newItem = $('<li class="new">item </li>');
```

creates a variable newItem to store a jQuery object which contains an element with a class and text

Elements – inserting new and adding new content

.before()

.after()

 item

.prepend()

.append()

Elements – inserting new and adding new content

Example: adding-new-content.html

```
$(function() {  
  $('ul').before('<p class="notice">Just updated</p>');  
  $('li.hot').prepend('+ ');  
  var $newListItem = $('<li><em>gluten-free</em> soy sauce</li>');  
  $('li:last').after($newListItem);  
});
```

Elements – cut, copy, paste

- `.remove()` removes matched elements from DOM tree (including any descendants and text nodes)
- `.detach()` same as `.remove` but keeps a copy of them in memory
- `.empty()` removed child nodes and descendants from any elements in matched set
- `.unwrap()` removes parents of matched set, leaving matched elements
- `.clone()` creates a copy of the matched set (including any descendants and text nodes)

Elements – cut, copy, paste

Example: cut-copy-paste.html

```
$(function() {  
  var $p = $('p');  
  var $clonedQuote = $p.clone();  
  $p.remove();  
  $clonedQuote.insertAfter('h2');  
  var $moveItem = $('#one').detach();  
  $moveItem.appendTo('ul');  
});
```

Elements – add and filter

- `.add` selects all elements that contain the text specified (parameter is case sensitive)
- `.filter()` finds elements in matched set that in turn match a second selector
- `.find()` finds descendants of elements in matched set that match the selector
- `.not()/:not()` finds elements that do not match the selector
- `.has()/:has()` finds elements from the matched set that have a descendant that matches the selector
- `:contains()` selects all elements that contain the text specified (parameter is case sensitive)

Elements – add and filter

Example: filters.html

```
$(function() {  
  var $listItems = $('li');  
  $listItems.filter('.hot:last').removeClass('hot');  
  $('li:not(.hot)').addClass('cool');  
  $listItems.has('em').addClass('complete');  
  $listItems.each( function() {  
    var $this = $(this);  
    if ($this.is('.hot')) {  
      $this.prepend('Priority item: ');  
    }  
  });  
  $('li:contains("honey")').append(' (local)'); });
```

Elements- exercise

Exercise:

1. Create a simple unordered list with contains 5 items
2. Create a CSS class “priority” (text=em/bold) and apply it to all list items
3. Create a CSS class “basic” (text=smaller) Use .filter() method to find last list item with a class attribute “priority”
4. Remove class “priority” from the last list item
5. Use :not() method to find list item without class “priority”
6. Use .addClass() method to add class “regular” to that list item
7. Use .prepend() method to add < shape before each list item
8. Use .clone() method to copy the entire list and duplicate it after the first list (use <p> to separate the lists)

jQuery Attributes

Attributes

- `.attr()` gets/sets a specified attribute and its value
- `.removeAttr()` removes a specified attribute and its value
- `.addClass()` adds a new value to the existing value of the class attribute
- `.removeClass()` d=removes a value from a class attribute

Attributes

Example: attributes.html

```
$(function() {  
  $('li#three').removeClass('hot');  
  $('li.hot').addClass('favorite');  
  $('ul').attr('id', 'group');  
});
```

CSS properties

`.css()` gets and sets the values of CSS properties

```
var background = $('li').css('background-color');
```

```
$('li').css('background-color', '#272727');
```

sets the bg color of all list items

```
$('li').css('padding-left', '+=20');
```

Increases the value of left padding by 20

CSS properties

Example: css.html

```
$(function() {  
  var backgroundColor = $('li').css('background-color');  
  $('ul').append('<p>Color was: ' + backgroundColor + '</p>');  
  $('li').css({  
    'background-color': '#c5a996',  
    'border': '1px solid #fff',  
    'color': '#000',  
    'text-shadow': 'none',  
    'font-family': 'Georgia',  
    'padding-left': '+=75'  
  });  
});
```

CSS properties

Exercise:

Using the previous exercise,

Use `.css()` methods to add

- Extra padding on the top of each list item
- Change typeface to “helvetica”
- Change the color of the text to white
- Change the background color to dark green

Loop

`.each()` allows to perform statements on each of the items in the selection of elements

`this` the current element

```
$('#li').each(function() {  
    var ids = this.id;  
    $(this).append(' <span class="order">' + ids + '</span>');  
});
```

Loop

Example: each.html

```
$(function() {  
  $('li').each(function() {  
    var ids = this.id;  
    $(this).append(' <span class="order">' + ids + '</span>');  
  });  
});
```

Loop

Exercise:

Continue in the previous exercise file,

Use `.each()` method to add text decoration = underline to each of the list items
